

What are vaccinations?

Vaccinations are the administration to the general public of antigenic materials to help the body become immune to the injected substance. The antigenic materials are small doses of bacteria or viral illnesses that can either be in weakened forms, dead or even inactive forms.

The benefits of using vaccinations are to help accustom the body to recognize the disease and to fight it effectively. Vaccinations have been widely used across the world on babies, young children and pregnant mothers because of their efficacy and low cost to administer in large quantities to the public to decrease the spread of diseases.

Homeopathic Prophylaxis

*Natural, safe, and
effective alternatives to
vaccinations*

The Immune Response and How vaccinations work

When the body contracts a disease (pathogen) the immune response kicks in producing antibodies (a protein) and lymphocytes (white blood cells). Among these white blood cells are specialized white blood cells called memory cells (Memory B cells). The memory cells help our body to remember the infectious pathogen (disease) so that when our body encounters it over the years our body recognizes it and is able to kill it before it causes any damage.

Vaccinations work by injecting into the blood stream weakened/dead/or inactive pathogens. This creates the same immune response as if a disease was contracted. After the immune response takes place as mentioned, the end result is memory cells which circulate throughout the blood stream should the body ever come in contact with that disease again.

This thus boosts immunity toward that disease making it less possible for that organism to get sick from that disease. Vaccinations are very effective at this approach, so what are the risks?

Side effects and risks of using Vaccinations

Vaccinations do inject diseases into the body whether they be weakened forms/dead/ or even inactive forms, because of this there are risks and side effects involved with vaccines even more so with babies, young children and pregnant mothers.

Side Effects include:

- Low- High grade fevers
- Cold and Flu
- Epilepsy/seizures
- Cancer, Diabetes
- Autism in children has been linked to mother's who received vaccinations during pregnancy.
- Diphtheria, Tetanus, Pertussis

- Miscarriage/ stillbirth/ SID
- Paralysis, and even Death

Homeopathic Prophylaxis

Homeopathic prophylaxis is done by using serial dilutions of the substance that we wish to vaccinate against. By using serial dilutions we remove the toxicity of the substance but also enhance the substances healing properties and remove undesirable side effects caused by the crude form. Homeopathic prophylaxis stimulates the body's immune response similar to the way vaccinations work. Homeopathic prophylaxis is a safe alternative to vaccinations and requires no injections. The prophylaxis is administered on pellets and has proven to be just as effective! Homeopathic Prophylaxis is great for protecting newborns and also great at protecting travelers from serious diseases.
